Figure 1: Overview of the printed circuit board (PCB) structure. The parameters are named as found in the data files.

# 1 Introduction

You can find all information regarding the printed circuit board (PCB) structure and setup in the following chapters. The PCB is described by the stackup, (order, type, material, thickness of layers) the board geometry (height, width), the via geometry (via radius, via antipad, etc.), the transmission lines (width, thickness, material) only if applicable and connectivity of vias, planes and transmissions lines.

Each of the previously mentioned aspects has an individual chapter. If instead of a numerical value a variable (*italic letters*) is given this parameter is varied during the electromagnetic (EM) simulations. Further information can be found in Section 3.

## 1.1 How to Cite?

If you use the provided data you have to reference by using at least the following Open Access paper [1] as well as the original publication of this dataset [2]:

M. Schierholz et al., "SI/PI-Database of PCB-Based Interconnects for Machine Learning Applications," in *IEEE Access*, vol. 9, pp. 34423-34432, 2021, doi: 10.1109/ACCESS.2021.3061788.

T.Hillebrecht et al., "Modeling and Improving Transmission of High-Speed Vias on PCBs up to 200 GHz," in *2026 IEEE 30th Workshop on Signal and Power Integrity (SPI)*, 2026, to be published.

## 1.2 License

Please be also aware of our license agreement. You can find further information in Section 5

## 1.3 Data Structure

Included in the download are multiple files and folders, See Table 1. See Fig. 1 for the parameter definitions.

## 1.4 Usage in Publications

This data set was used in the following publications:

- [2]

Table 1: Data Directory

Name	Type	Description
Description.pdf	PDF-Document	This Description
parameter.csv	CSV Document (Delimiter = ',')	Parameter file with all parameter variations, see Section 3.
variation/	Directory	Directory having all EM simulation results (S-Parameter), see Section 4

## 2 PCB Structure

The structure is a PCB with multiple planes, vias and materials. The vias and the stackup is explained in the following sections. If a parameter (*italic font*) instead of a numerical value is given this parameter was changed during the EM simulation. Further information of the parameters can be found in Section 3.

### 2.1 Board Size

The board has a rectangular shape, see Fig. 1. The dimensions are not important since a perfectly matched layer (PML) boundary condition is used for simulation.

### 2.2 Stackup

The structure has *num\_layers* cavities with planes, and dielectrics. The planes are modeled as solid planes over the total size of the PCB. An overview of the largest stackup is shown in Table 2. All other stackups are a fraction of this stackup with identical dimensions of each layer but with different layer counts. There are three possible sizes represented in Table 2 reaching from layer 0 to layer 2, 6 and 16 respectively.

The connectivity of a layer is used to connect corresponding vias. Dielectric Material is not connected to any net. The Material definitions are shown in Table 3.

Table 3: Printed Circuit Board Material

<b>Name</b>	<b>PEC</b>	<b>dielmoat</b>
<b>Type</b>	conductor	dielectric
<b>Conductivity</b> $\sigma \left(\frac{S}{m}\right)$	$10^{99}$	not applicable
<b>Rel. Permittivity</b> $\epsilon_r$	not applicable	3.5
<b>Loss Tangent</b>	not applicable	0
<b>Rel. Permeability</b> $\mu_r$	1.0	1.0

Table 2: Printed Circuit Board Stackup

<b>Layer</b>	<b>Type</b>	<b>Connectivity</b>	<b>Material</b>	<b>Thickness</b>
0	plane	GND	PEC	0.7 mil
1	dielectric	None	dielmoat	12 mil
2	plane	GND	PEC	0.7 mil
3	dielectric	None	dielmoat	12 mil
4	plane	GND	PEC	0.7 mil
5	dielectric	None	dielmoat	12 mil
6	plane	GND	PEC	0.7 mil
7	dielectric	None	dielmoat	12 mil
8	plane	GND	PEC	0.7 mil
9	dielectric	None	dielmoat	12 mil
10	plane	GND	PEC	0.7 mil
11	dielectric	None	dielmoat	12 mil
12	plane	GND	PEC	0.7 mil
13	dielectric	None	dielmoat	12 mil
14	plane	GND	PEC	0.7 mil
15	dielectric	None	dielmoat	12 mil
16	plane	GND	PEC	0.7 mil

### 2.3 Via

The vias have multiple dimensional aspects, an overview is given in Fig. 2. The dielectric material (Dielectric) is the material from the dielectric layer, see Table 2. For each via array different via parameters are possible e.g. via radius.

Figure 2: Overview of the via parameter e.g. via-radius. Pad radius signal and pad radius plane is relevant in the signal layer and plane layer respectively.

### 2.3.1 Via Model and Array

There are two signal vias with *num\_gnd* ground vias surrounding each of them in a circle to form a coaxial via [3], see Fig. 1. The ground and signal vias have a distance of *pitch*. All ground vias are connected to all ground planes.

Table 4: Parameters Via Model: *st\_via*

Parameter	Value (mil)
name	st_via
via_radius	5 mil
inner_radius	0.0
pad_radius_signal	0.0
antipad_radius	8 mil
pad_radius_plane	0
material	PEC
cap_type	auto
cap_fd	no
cap_cfu	0.0
cap_cfl	0.0

### 3 Parameter Variation

Some parameters of the PCB are varied throughout the EM simulations. Parameters are in general marked by italic letters. All parameter variations are stored in the file `<parameter.csv>`, see Section 3.1.

#### 3.1 Parameter Storage File `<parameter.csv>`

The file `<parameter.csv>` is a tabular file with multiple columns (Delimiter = ',') and rows. The first row has all the parameter names as named in the tables and figures of this document. Each row corresponds to a single EM simulation. By the column *simu\_index* the corresponding network parameters can be found in the `variation` folder.

### 4 EM-Simulation

The EM simulations were performed with the FDTD solver of Feko © by Siemens Industry Software Inc. © [4]. The simulations are performed with PML boundary conditions. The frequency spectrum is 1 GHz to 200 GHz with 400 linearly spaced frequency points.

## 5 License agreement for usage of the SI/PI-Database

Institut für Theoretische Elektrotechnik, TUHH - December 2020

The SI/PI-Database is a collection of printed circuit board based structures which represent different electromagnetic aspects for signal integrity and power integrity applications. The structures have different components and interconnecting elements e.g. vias, via-arrays, power, ground planes. Each structure contains many variations with the according simulation results. All structures were simulated with a physics-based approach developed by TUHH.

The SI/PI-Database may be used free of charge as long as the following terms and conditions are agreed upon. By using the data the user agrees that the following terms and conditions are being met:

1. The SI/PI-Database and its documentation (manual, examples and alike) are solely owned and distributed by the Institut für Theoretische Elektrotechnik, Hamburg University of Technology (TUHH), Hamburg, Germany. It is not allowed to distribute, sell, share, or make available any part of the data or the documentation to third parties.
2. The SI/PI-Database may only be used for purposes that are strictly non-armaments related and in general only directed to improve science, technology and their appropriate application for the benefit of humanity. Any commercial usage on a for-profit basis, or for armaments related purposes are not allowed.
3. The SI/PI-Database may be used within the same department / group as often as wanted. Any distribution beyond the same department or group is not allowed. Especially it is forbidden to host the database in the form of a web service or internet platform.
4. The SI/PI-Database is not free of errors nor does the Institut für Theoretische Elektrotechnik guarantee that its data is correct. Every user is responsible for carefully checking the validity of SI/PI-Database data. The Institut für Theoretische Elektrotechnik cannot be held responsible for any consequences or conclusions from the data of the SI/PI-Database. If the user becomes aware of incomplete or unfeasible data the Institut für Theoretische Elektrotechnik should be notified.
5. All users agree to be listed by department/group/institute name, and name of university/company/institution on our SI/PI-Database. For this purpose the name, e-mail address, affiliation and department will be stored.
6. When data from the SI/PI-Database is used the following reference has to be given: M. Schierholz, A. Sanchez-Masis, A. Carmona-Cruz, X. Duan, K. Roy, C. Yang, R. Rimolo-Donadio, and C. Schuster, "SI/PI-database of PCB based interconnects for ma-

chine learning applications,” *IEEE Access*, vol. 9, pp. 34 423–34 432, Feb. 2021

7. All users agree that it is their own responsibility to check the data of the SI/PI-Database that has been provided to them to be free of any virus malware or alike before using it and inform the Institut für Theoretische Elektrotechnik if there are any problems. The Institut für Theoretische Elektrotechnik is taking precautions but cannot guarantee for the integrity of the data.

## 6 Contact

You can find the contact information and the person in charge SI/PI-Database at TET:
